Practical no 5

Aim:

To develop a Translation Application using AngularJS that translates words from English to another language using predefined translations.

Steps:

1. Create an HTML file.
2. Include AngularJS CDN.
3. Create an AngularJS module and controller.
4. Create an input field for entering words.
5. Store translations in a JavaScript object.
6. Implement the translate function.
7. Run the application in a browser.
8. Enter words and view their translations.

Code:

```
<!DOCTYPE html>
 <html ng-app="translationApp">
 <head> <title>AngularJS Translation Application</title>
    <script
src="https://ajax.googleapis.com/ajax/libs/angularjs/1.8.2/angular.min.js"
></script>
</head>
 <body ng-controller="translationController">
    <h2>Translation Application</h2>
    <input type="text" ng-model="word" placeholder="Enter English Word">
    <button ng-click="translate()">Translate</button>
    <h3>Translation: {{translatedWord}}</h3>
     <script>
     var app = angular.module("translationApp", []);
      app.controller("translationController", function ($scope) {
        var dictionary = { "hello": "नमस्ते", "good": "अच्छा", "book":
"किताब", "water": "पानी", "computer": "कंप्यूटर" };
        $scope.translate = function () {
            var input = $scope.word.toLowerCase();
            if (dictionary[input]) { $scope.translatedWord =
dictionary[input];
            } else { $scope.translatedWord = "Translation Not Found"; } };
             });
```

```
            </script>
             </body>
              </html>
```
