Practical no 7

Aim:
To create a simple web server using Node.js and Express.js and display a response in the browser.

Theory:
Node.js is a JavaScript runtime environment that allows JavaScript to run outside the browser. Express.js is a lightweight web application framework for Node.js that simplifies the process of creating web servers and handling HTTP requests.

In this practical, a simple Express server is created that listens on a specific port and sends a response when the user accesses the server through a web browser.

Concepts Used:

- Node.js
- Express.js
- HTTP Request and Response
- Routing
- Port Number

Steps to Install Express:

1. Create a project folder.
2. Open Terminal in the project folder.
3. Initialize Node.js project:

```
npm init -y
```

4. Install Express:

```
npm install express
```

Code (server.js):

```
const express = require('express');

const app = express();

const PORT = 3000;

app.get('/', (req, res) => {
```

```
    res.send('Welcome to Express Server');
});

app.listen(PORT, () => {
    console.log(`Server running on port ${PORT}`);
});
```

Run the Server:

node server.js

Then open:

http://localhost:3000
