Practical no 3

Aim:
To develop a Shopping List application using AngularJS that allows users to add and remove items dynamically.

Theory:
AngularJS is a JavaScript framework developed by Google for creating dynamic and interactive web applications. It follows the MVC (Model-View-Controller) architecture and supports two-way data binding, which automatically updates the user interface when data changes.

In this application, users can:

- Add items to a shopping list.
- View the list instantly.
- Remove items from the list.

Concepts Used:

- AngularJS Module
- Controller
- ng-app Directive
- ng-model Directive
- ng-repeat Directive
- ng-click Directive

Code

```
<!DOCTYPE html>
<html ng-app="shoppingApp">

<head>
    <meta charset="UTF-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">
    <title>Shopping List</title>

    <script
src="https://ajax.googleapis.com/ajax/libs/angularjs/1.8.2/angular.min.js"
></script>
</head>
```

```
<body ng-controller="shoppingController">

    <h2>Shopping List</h2>

    <input type="text" ng-model="newItem" placeholder="Enter item">

    <button ng-click="addItem()">Add Item</button>

    <ul>
        <li ng-repeat="item in shoppingItems">
            {{item}}
            <button ng-click="removeItem($index)">Remove</button>
        </li>
    </ul>

    <script>
        var app = angular.module("shoppingApp", []);

        app.controller("shoppingController", function ($scope) {

            $scope.shoppingItems = [];

            $scope.addItem = function () {
                if ($scope.newItem) {
                    $scope.shoppingItems.push($scope.newItem);
                    $scope.newItem = "";
                }
            };

            $scope.removeItem = function (index) {
                $scope.shoppingItems.splice(index, 1);
            };

        });
    </script>

</body>
</html>
```
